Tel: 613 9069 9179 / 612 8188 9052

Inspection cover:

Once you've booked an inspection of your system with us, one of our licensed solar electricians will come out to site to review the different components of your system. We will look for any wear and tear and check if anything is preventing from running as it should. This includes excess dust, damage from weather, water accumulation, integrity of seals etc. The technician will also perform electrical checks to make sure that your system is safe. These include checking voltages, fuses and ensuring that protective devices are still functioning.

Once everything is complete you will receive a report which covers the result of the service and any recommendations we may have.

Does Not Inspection cover:

Our technicians are qualified and experienced in solar, they will be able to tell you if anything needs to be repaired or replaced. However the service does not cover on the spot repairs. If there is an issue with the system we will get in touch to book in a proper repair – we do this to ensure that we fully understand the issue and that we have the proper parts/equipment with us.

If you would like your panels cleaned please let us know. Solar PV panels have a durable glass coating and are installed at a angle where rainwater can usually provide adequate cleaning. We only recommend cleaning in situations such as excessive dust, bird droppings or vegetation cover. Your technician will advise you if your panels need cleaning when on site.
